## THE NATIONAL BUREAU OF STANDARDS

The scope of activities of the National Bureau of Standards is suggested in the following listing of the divisions and sections engaged in technical work. In general, each section is engaged in specialized research, development, and engineering in the field indicated by its title. A brief description of the activities, and of the resultant reports and publications, appears on the inside of the back cover of this report.

**Electricity.** Resistance Measurements. Inductance and Capacitance. Electrical Instruments. Magnetic Measurements. Applied Electricity. Electrochemistry.

**Optics and Metrology.** Photometry and Colorimetry. Optical Instruments. Photographic Technology. Length. Gage.

**Heat and Power.** Temperature Measurements. Thermodynamics. Cryogenics. Engines and Lubrication. Engine Fuels. Cryogenic Engineering.

**Atomic and Radiation Physics.** Spectroscopy. Radiometry. Mass Spectrometry. Solid State Physics. Electron Physics. Atomic Physics. Neutron Measurements. Infrared Spectroscopy. Nuclear Physics. Radioactivity. X-Rays. Betatron. Nucleonic Instrumentation. Radio-logical Equipment. Atomic Energy Commission Instruments Branch.

**Chemistry.** Organic Coatings. Surface Chemistry. Organic Chemistry. Analytical Chemistry. Inorganic Chemistry. Electrodeposition. Gas Chemistry. Physical Chemistry. Thermo-chemistry. Spectrochemistry. Pure Substances.

**Mechanics.** Sound. Mechanical Instruments. Aerodynamics. Engineering Mechanics. Hydraulics. Mass. Capacity, Density, and Fluid Meters.

**Organic and Fibrous Materials.** Rubber. Textiles. Paper. Leather. Testing and Specifications. Polymer Structure. Organic Plastics. Dental Research.

**Metallurgy.** Thermal Metallurgy. Chemical Metallurgy. Mechanical Metallurgy. Corrosion.

**Mineral Products.** Porcelain and Pottery. Glass. Refractories. Enameled Metals. Concreting Materials. Constitution and Micro-structure. Chemistry of Mineral Products.

**Building Technology.** Structural Engineering. Fire Protection. Heating and Air Conditioning. Floor, Roof, and Wall Coverings. Codes and Specifications.

**Applied Mathematics.** Numerical Analysis. Computation. Statistical Engineering. Machine Development.

**Electronics.** Engineering Electronics. Electron Tubes. Electronic Computers. Electronic Instrumentation.

**Radio Propagation.** Upper Atmosphere Research. Ionospheric Research. Regular Propagation Services. Frequency Utilization Research. Tropospheric Propagation Research. High Frequency Standards. Microwave Standards.

**Ordnance Development.** These three divisions are engaged in a broad program of research and development in advanced ordnance. Activities include **Electromechanical Ordnance.** basic and applied research, engineering, pilot production, field testing, and evaluation of a wide variety of ordnance matériel. Special skills and facilities of other NBS divisions also contribute to this program. The activity is sponsored by the Department of Defense.

**Missile Development.** Missile research and development: engineering, dynamics, intelligence, instrumentation, evaluation. Combustion in jet engines. These activities are sponsored by the Department of Defense.

CATALOG  
OF  
AVAILABLE TROPOSPHERIC FIELD STRENGTH DATA

By

J. W. Herbstreit, P. L. Rice and P. J. Short  
National Bureau of Standards  
Boulder, Colorado

ABSTRACT

At frequencies above 50 Mc climate, meteorological conditions in the troposphere, and the shape of terrain irregularities play the principal roles in determining the strength and distance that a signal will be propagated. A catalog of tropospheric propagation radio field strength data covering approximately 200 propagation paths for distances from 33 to 616 miles and frequencies from 41 to 1046 Mc is presented in order to disseminate the information available at the National Bureau of Standards.

\* \* \* \* \*

The Central Radio Propagation Laboratory of the National Bureau of Standards was established at the close of World War II to centralize and coordinate radio propagation research which was being conducted throughout the United States in the entire frequency spectrum. As a result of the War, the development of techniques and applications for the portion of the radio frequency spectrum above approximately 50 Mc was tremendously accelerated. New applications included radar, communications with aircraft, navigational and guidance systems for aircraft, ground-to-ground radio relay and communications systems, a new system of broadcasting using frequency modulation, television, and many others. The centralization and coordination of propagation research efforts in one agency lend themselves readily to attacking the propagation aspects of these new applications of the radio frequency spectrum in a coordinated, systematic manner for the many users of radio propagation information.

In the standard broadcast band electrical characteristics of the soil and conditions of the lower ionospheric regions play the dominant roles in determining the strength and distance that

a signal will be propagated, while in the international band below 50 Mc, the condition of the ionosphere alone is the dominant factor. At frequencies above 50 Mc, climate, meteorological conditions in the troposphere, and the shape of terrain irregularities play the principal roles, and every different climatological and terrain situation influences the radio wave propagation characteristics. It has been determined that propagation data which will have useful application under the various conditions of climate and terrain encountered throughout the world must be obtained from a variety of geographical locations and over extended periods of time. In general it has been found desirable to record field strength over particular paths for a period of one year at least to determine the seasonal factors. Recordings for much shorter periods of time are also of value. Many such recordings are listed in this catalog. Measurements made with mobile equipment are desirable to study terrain factors affecting propagation and it is expected to later include a listing of such measurements.

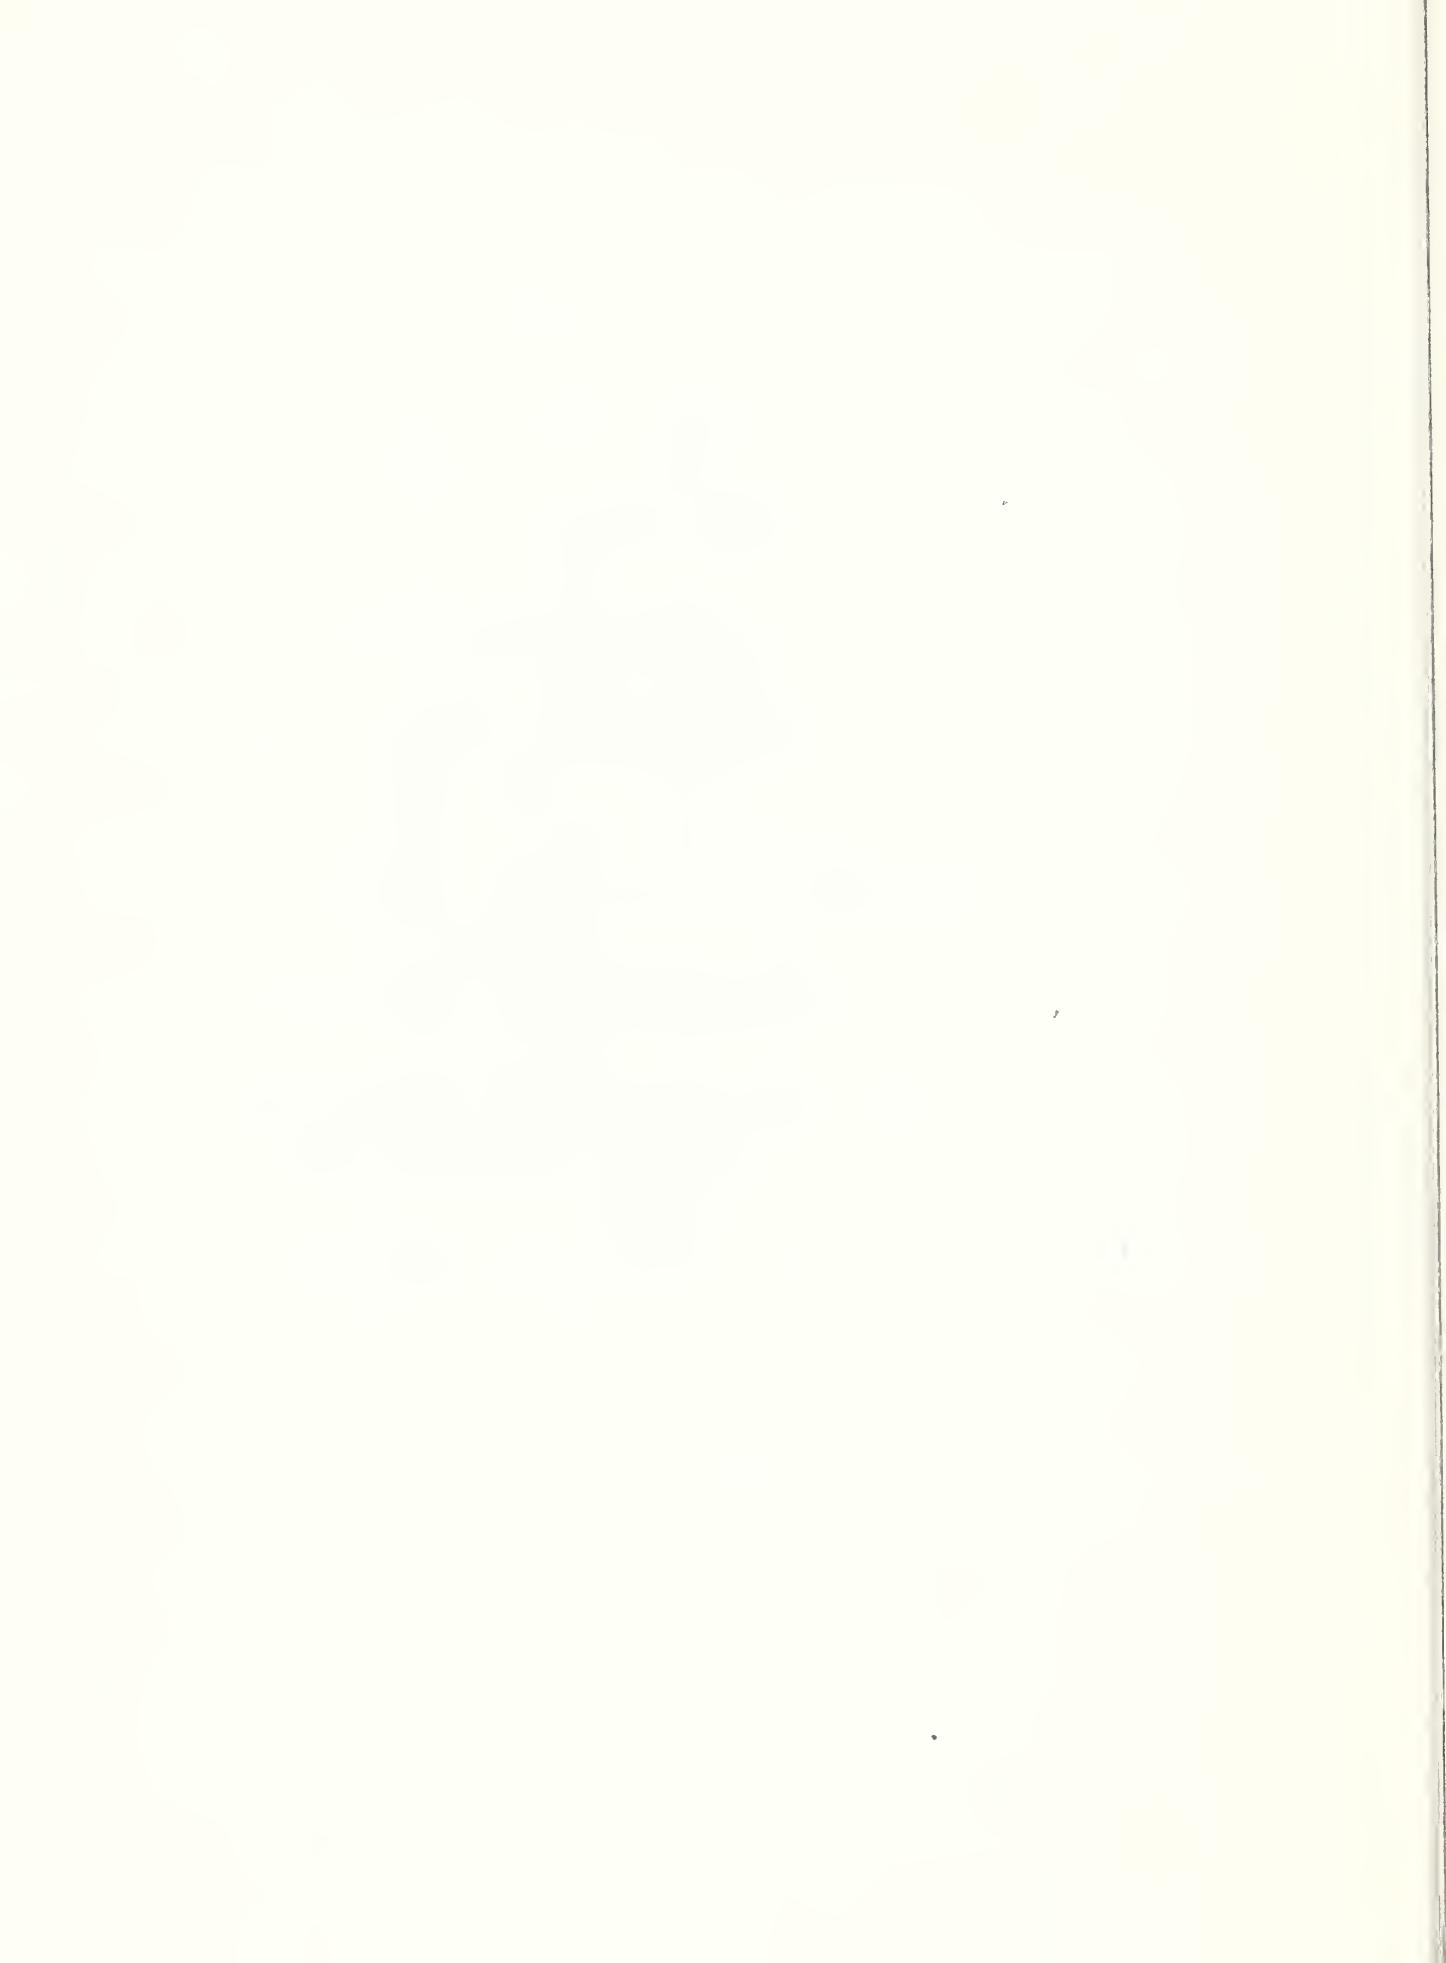

Tropospheric radio propagation data presently available have been cataloged. This report is to supersede NBS Report 2011. There has been a number of recordings added to the catalog as well as a large number of corrections especially to the data which are of interest to the NBS at the present.

The revised version of the catalog represents a considerable improvement over the previous edition; however, it is far from being completed. It is hoped that more information of this type will be brought to the attention of the compilers.

Interested individuals or organizations are invited to supply corrections to this catalog.

TABLE OF PARAMETERS INCLUDED  
IN CATALOG OF TROPOSPHERIC FIELD STRENGTH DATA

<u>Parameter</u>	<u>Unit</u>	<u>Symbol</u>
Distance from transmitter to receiver	Statute miles	
Frequency	Megacycles	
Transmitter power output	Decibels above one watt	$P_t$
Transmission line losses at transmitter	Decibels	$L_t$
Transmitting antenna gain	Decibels above an isotropic antenna	$G_t$
Receiving antenna gain	Decibels above an isotropic antenna	$G_r$
Effective radiated power in direction of receiver	Decibels above one watt	ERP
Transmitting antenna height	Feet	$h_t$
Receiving antenna height	Feet	$h_r$

Distance in miles	Transmitter and Location	Months Recorded	$P_t$ in DB above 1 watt	$G_t$ in DB	ERP in $D^3$ above 1 watt
					$P_t + G_t - L_t - 2.15$
Frequency in Mc	Recording Agency and Location	Hours Recorded	$L_t$ in DB	$G_r$ in DB	$h_t$ in feet $h_r$ in feet
4 mi	Mosseberg, Sweden	1/49 - 6/49		horn	
29979 Mc	Swedish Tech. Re- search Council, Backa, Sweden	24 hrs/day		horn	
8.4 mi	Mosseberg, Sweden	1/49 - 6/49		paraboloid	
2998 Mc	Swedish Tech. Re- search Council, Backa, Sweden	24 hrs/day		paraboloid	
8.4 mi	Mosseberg, Sweden	1/49 - 6/49		horn	
9993 Mc	Swedish Tech. Re- search Council, Kärra, Sweden	24 hrs/day		horn	

\* Height of antenna above 2-10 mile average terrain in the direction of the other antenna.

\*\* Height of antenna above 2-10 mile average surrounding terrain.

\*\*\* Height of antenna above ground.

\*\*\*\* Height of antenna above mean sea level.

Transmitting antenna greater than or equal to this figure. Given in db above an isotropic antenna.

Y

## THE NATIONAL BUREAU OF STANDARDS

### Functions and Activities

The functions of the National Bureau of Standards are set forth in the Act of Congress, March 3, 1901, as amended by Congress in Public Law 619, 1950. These include the development and maintenance of the national standards of measurement and the provision of means and methods for making measurements consistent with these standards; the determination of physical constants and properties of materials; the development of methods and instruments for testing materials, devices, and structures; advisory services to Government Agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; and the development of standard practices, codes, and specifications. The work includes basic and applied research, development, engineering, instrumentation, testing, evaluation, calibration services, and various consultation and information services. A major portion of the Bureau's work is performed for other Government Agencies, particularly the Department of Defense and the Atomic Energy Commission. The scope of activities is suggested by the listing of divisions and sections on the inside of the front cover.

### Reports and Publications

The results of the Bureau's work take the form of either actual equipment and devices or published papers and reports. Reports are issued to the sponsoring agency of a particular project or program. Published papers appear either in the Bureau's own series of publications or in the journals of professional and scientific societies. The Bureau itself publishes three monthly periodicals, available from the Government Printing Office: The Journal of Research, which presents complete papers reporting technical investigations; the Technical News Bulletin, which presents summary and preliminary reports on work in progress; and Basic Radio Propagation Predictions, which provides data for determining the best frequencies to use for radio communications throughout the world. There are also five series of nonperiodical publications: The Applied Mathematics Series, Circulars, Handbooks, Building Materials and Structures Reports, and Miscellaneous Publications.

Information on the Bureau's publications can be found in NBS Circular 460, Publications of the National Bureau of Standards (\$1.00). Information on calibration services and fees can be found in NBS Circular 483, Testing by the National Bureau of Standards (25 cents). Both are available from the Government Printing Office. Inquiries regarding the Bureau's reports and publications should be addressed to the Office of Scientific Publications, National Bureau of Standards, Washington 25, D. C.
